

Add serial number from iDMSS & GDMSS to DMSS

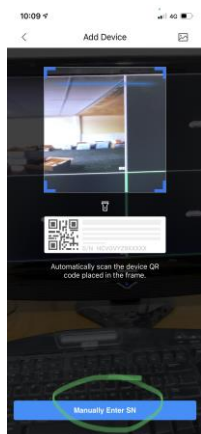

- After finding the serial number from the previous app you will want to download DMSS to iPhone or an Android device.
- Once completing the download, go into the app and click on the plus icon in the top right corner.

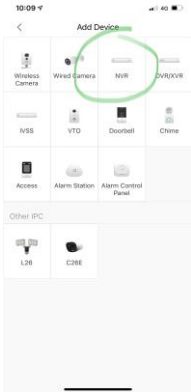

- Then go into SN/Scan.

- This will allow you to either scan a code or manually input your serial number.
- Enter the serial number from the screenshot from the previous app.

- Once that has been completed the app will bring up a series of devices you can choose from.
- In this scenario we are setting up an NVR, that is the one we will be selecting.

- This will bring you to the add device screen.
- The serial number will already be there, now type in the username and password to the device.
- Also add a device name and then save.

- Now you have access to your device like on the older iDMSS and GMSS apps.
